Instructions for using Oragene Saliva Collection Kit (English)

1. Open the contents of the kit. Notice that there is a clear plastic cup and a blue cap. The blue cap has some liquid in it. After you collect saliva, you will screw the blue cap onto the top, which will tear the seal, and the liquid from the cap will be released into the saliva. The liquid from the cap contains a stabilizer. Do not peel the plastic off of the cap.

2. When you are ready to start, please be sure that you are using the Oragene kit with your name on it. Do not use the kit belonging to anyone else. Do not spit into any kits other than your own.

3. Do not eat or drink anything for 30 minutes.

4. Spit your saliva into the vial until it fills the bottom up to curve. This should take you about 15 minutes of spitting. Do not spit any phlegm. Just spit the water from the mouth.

5. Once you have made enough saliva, screw the blue cap onto the top. Please be very careful with this part, so as not to spill the contents.

6. Please place the kit on a flat surface and be sure that the cap is screwed on straight and not crooked. Please ensure that the blue cap is screwed on very tightly and evenly, and that it is not leaking.

7. Please invert the sample several times to ensure good mixing. Please check again that the cap is screwed evenly onto the base. If it not screwed on evenly, please unscrew and rescrew to make ensure that the contents are sealed.
